

7/22/21

QuickSort(arr[], start, end)

Step 1 = if (start < end)

step 2 = set  $p = \text{Partition}(\text{arr}, \text{start}, \text{end})$

Step 3 = Quick Sort (arr, start, p-1)

Step 4 = Quick Sort (arr, p+1, end)  
end if

Partition (arr[], start, end)

step 1 = set pivot = arr[start]

Step 2 = Set  $i = \text{start} + 1$ ; and  $j = \text{end}$ ;

Step 3 = do if ( $i < j$ )

```
step 4 = if (arr[i] <= pivot)
           then i++;
```

step 5 = if (arr[j] > pivot)  
then j--;

Step 6 = if ( $i \leq j$ )

if (i < j)  
then swap(arr[i], arr[j])

step 7 = swap (arr[start], arr[j])

Step 8 = return j.

According to given array,

45	34	23	68	91	12
----	----	----	----	----	----

↑  
 pivot

↑  
 i

↑  
 j

Pass 1 :

45	34	23	68	91	12
----	----	----	----	----	----

↑  
pivot

Brjapati Yash.P. 20162121023

Pass 2 :- 

12	34	23	45	91	68
----	----	----	----	----	----

Pass 3 :- 

--	--	--	--	--	--	--	--

4

The elements of the tree from top, left and right are :-

14 → 2 → 1 → 3 → 11 → 10 → 7 → 30 → 40

(A) Inorder Traversal :-

Step 1 :- visit all nodes in left

Step 2 :- visit root nodes

Step 3 :- visit ~~root~~ nodes in right.

~~root~~

∴ Inorder = 1, 2, 3, 14, 7, 10, 40, 30, 11, 14

(B) Pre-order Traversal :-

Step 1 :- visit root

Step 2 :- visit left nodes

Step 3 :- visit right nodes.

∴ Preorder = 14, 2, 1, 3, 11, 10, 7, 30, 40

Brajapati Yash. P.

20162121023

(C) Post-order Traversal :-

Step 1:- visit all left nodes

Step 2:- visit all right nodes

Step 3:- visit root

 $\therefore$  Post order = 1, 3, 2, 7, 10, 40, 30, 11, 14A3

Size = 10

Keys = (70, 45, 23, 56, 32, 26, 35, 66, 54, 91)

hash function  $\Rightarrow h(k) = k \bmod 10$ 

$$\Rightarrow h(70) = 70 \bmod 10 = 0$$

$$\Rightarrow h(45) = 45 \bmod 10 = 5$$

$$\Rightarrow h(23) = 23 \bmod 10 = 3$$

$$\Rightarrow h(56) = 56 \bmod 10 = 6$$

$$\Rightarrow h(32) = 32 \bmod 10 = 2$$

$$\Rightarrow h(26) = 26 \bmod 10 = 6$$

as 6 is occupied by 56,  
we use linear probing.

$$h(k, i) = (h(k) + i) \bmod m$$

Pratapati Yash.P. : 20162121023

$$\therefore h(k, i) = (h(k) + i) \bmod 10$$

$$i = 0 \text{ to } 9 \quad (\text{size of hash table})$$

$$\text{Now, } (6+1) \bmod 10$$

$$= 7 \bmod 10$$

$$h(26) = 7$$

$$\Rightarrow h(35) = 35 \bmod 10$$

$$= 5$$

but 5 is already occupied by 45

$$\therefore h(k, i) = (h(k) + i) \bmod 10$$

$$h(5, 1) = 5 + 1 \bmod 10$$

$$= 6 \bmod 10$$

$$= 6 \text{ . it is also occupied.}$$

$$\therefore h(5, 2) = (5 + 2) \bmod 10$$

$$= 7 \bmod 10 = 7 \text{ . it is also occupied}$$

$$\therefore h(5, 3) = 8 \bmod 10$$

$$h(35) = 8$$

$$\Rightarrow h(66) = 66 \bmod 10 = 6$$

Now, as we know, 6, 7, 8 are occupied

$$\therefore h(6, 3) = (6 + 3) \bmod 10 = 9$$

$$\Rightarrow h(54) = 54 \bmod 10 = 4$$

$$\Rightarrow h(91) = 91 \bmod 10 = 1$$
